

R-VALUES FOR SINGLE WYTHE CONCRETE MASONRY WALLS

TEK 6-2A

Energy & IAQ (2005)

Keywords: insulation, reinforced concrete masonry, R-values, thermal insulation, thermal properties

INTRODUCTION

Concrete masonry walls are often constructed of hollow units with cores filled with loose fill material and/or grout. This construction method provides the minimum wall thickness, while allowing insulation and reinforcement to be included to increase thermal and structural performance, respectively.

Determining the thermal insulation values of these walls, however, can be time consuming, especially when the wall is composed of several materials. This TEK facilitates the determination of thermal resistance (R) and thermal transmittance (U) of these single wythe concrete masonry walls.

R-VALUE TABLES

Tables of calculated R-values for hollow block of 6, 8, 10 and 12 in. (152, 203, 254, and 305 mm) thicknesses, for concrete densities of 85 to 135 lb/ft³ (1362 to 2163 kg/m³) are included. In addition, Table 1 shows the approximate percentage of grouted and ungrouted wall area for different vertical and horizontal grout spacings, which can be used to determine R-values of partially grouted walls. Thermal properties used in compiling the tables are listed in Table 6.

In addition to the core insulations listed in Tables 2 through 5, polystyrene inserts are available which fit in the cores of concrete masonry units. Inserts are available in many shapes and sizes to provide a range of insulating values and accommodate various construction conditions. Specially designed concrete masonry units may incorporate reduced-height webs to accommodate inserts. Such webs also reduce thermal bridging through masonry, since the reduced web area provides a smaller cross-sectional area for heat flow through the wall. To further reduce thermal bridging, some manufacturers have developed units with two cross webs rather than three. In addition, some inserts have building code approval to be left in the grouted cores, thus improving the thermal performance of fully or partially grouted masonry walls.

The ASHRAE series-parallel method (also called isothermal planes) (ref. 1) was used to calculate the base case values (i.e., the row *Exposed block, both sides*) in Tables 2 through 5. This method accounts for the thermal bridging through the webs

Table 1—Percent Ungrouted Area/Percent Grouted Area For Partially Grouted Walls

| | | Vertical grout spacing, in. (mm) | | | | | |
|------------------------------------|--------------------|----------------------------------|--------------|--------------|-------------|-------------|-------------|
| | | no vert. grout | 48 (1219) | 40 (1016) | 32 (813) | 24 (610) | 16 (406) |
| Horizontal grout spacing, in. (mm) | no horiz. grout | 100 | 83 | 80 | 75 | 67 | 50 |
| | 0 | 17 | 20 | 25 | 33 | 50 | 50 |
| | 48 (1219) | 83 | 69 | 67 | 63 | 56 | 42 |
| | 17 | 31 | 33 | 37 | 44 | 58 | |
| | 40 (1016) | 80 | 67 | 64 | 60 | 53 | 40 |
| | 20 | 33 | 36 | 40 | 47 | 60 | |
| | 32 (813) | 75 | 63 | 60 | 56 | 50 | 37 |
| Horizontal grout spacing, in. (mm) | 25 | 37 | 40 | 44 | 50 | 63 | |
| | 24 (610) | 67 | 56 | 53 | 50 | 44 | 33 |
| | 33 | 44 | 47 | 50 | 56 | 67 | |
| | 16 (406) | 50 | 42 | 40 | 37 | 33 | 25 |
| | | 50 | 58 | 60 | 63 | 67 | 75 |

of concrete masonry units. R-values of the various finish systems are added to these base values. To determine R-values for walls with 2 in. (51 mm) of rigid insulation (expanded polystyrene, extruded polystyrene, or polyisocyanurate) rather than the 1 in. (25 mm) shown in the tables, simply add the appropriate insulation thermal resistivity value from Table 6 to the R-values in Tables 2 through 5.

R-values of concrete masonry walls are correlated to concrete density, since thermal conductivity of concrete increases with increasing density. Tables 2 through 5 list a range of R-values for each density, as well as a single value, which represents a calculated middle of the range. The U-factor is determined by simply inverting the R-value (i.e., $U = 1/R$).

A range of thermal values is appropriate for concrete products because the thermal conductivity of concrete cannot always be accurately estimated from density alone. The thermal conductivity of concrete varies with aggregate type(s) used in the concrete mix, the mix design, moisture content, etc.

These published values reflect a compendium of historical data on thermal conductivity of concrete (refs. 1,3). Locally available products and local conditions may result in thermal values which fall outside of this range. The middle-of-the-range values are presented for use in cases where more accurate values are not available from local manufacturers.

(continued on back page)

Table 2—R-Values For 6 in. (152 mm) Concrete Masonry Walls, hr²F/Btu^a

| Construction | Density of concrete, pcf | Cores empty | | Cores filled with ^b : | | | | | | | |
|---|--------------------------------|----------------|------|----------------------------------|------|-----------|------|-----------------------------------|------|---------------|------|
| | | | | Loose-fill insulation | | | | Polyurethane foamed insulation | | Solid grouted | |
| | | Perlite | | Vermiculite | | range | mid | range | mid | range | mid |
| Exposed block, both sides | 85 | 2.2-2.5 | 2.4 | 4.8-6.1 | 5.3 | 4.5-5.6 | 5.0 | 5.2-7.0 | 5.9 | 1.6-1.8 | 1.7 |

| | 105 | 12.8-13.0 | 12.9 | 14.3-15.6 | 14.8 | 14.1-15.3 | 14.6 | 14.5-16.0 | 15.1 | 12.2-12.4 | 12.3 |
| | 115 | 12.6-12.9 | 12.8 | 13.8-15.0 | 14.2 | 13.7-14.8 | 14.1 | 13.9-15.3 | 14.4 | 12.2-12.3 | 12.2 |
| | 125 | 12.5-12.8 | 12.6 | 13.3-14.5 | 13.8 | 13.3-14.3 | 13.7 | 13.4-14.7 | 13.9 | 12.1-12.3 | 12.2 |
| | 135 | 12.4-12.7 | 12.5 | 13.0-14.0 | 13.4 | 13.0-13.9 | 13.3 | 13.0-14.2 | 13.5 | 12.1-12.2 | 12.1 |

^a Notes: (hrF/Btu)(0.176) = m²K/W. Mortar joints are $\frac{3}{8}$ in. (10 mm) thick, with face shell mortar bedding assumed. Unit dimensions based on *Standard Specification for Loadbearing Concrete Masonry Units*, ASTM C 90 (ref. 2). Surface air films are included.

^b Values apply when all masonry cores are filled completely. Grout density is 140 pcf (2243 kg/m³). Lightweight grouts, which will provide higher R-values, are also available in some areas.

^c Installed over wood furring. Includes $\frac{1}{2}$ in. (13 mm) gypsum board and nonreflective air space.

^d Installed over wood furring. Includes $\frac{1}{2}$ in. (13 mm) gypsum board and reflective air space.

Table 3—R-Values For 8 in. (203 mm) Concrete Masonry Walls, hr ft^{2.0}F/Btu^a

| Construction | Density of concrete, pcf | Cores empty | | Cores filled with ^b : | | | | | | | |

^a Notes: (hr ft^{2.0}F/Btu) (0.176) = m²-K/W. Mortar joints are $\frac{3}{8}$ in. (10 mm) thick, with face shell mortar bedding assumed. Unit dimensions based on *Standard Specification for Loadbearing Concrete Masonry Units*, ASTM C 90 (ref. 2). Surface air films are included.

^b Values apply when all masonry cores are filled completely. Grout density is 140 pcf (2243 kg/m³). Lightweight grouts, which will provide higher R-values, are also available in some areas.

^c Installed over wood furring. Includes $\frac{1}{2}$ in. (13 mm) gypsum board and nonreflective air space.

^d Installed over wood furring. Includes $\frac{1}{2}$ in. (13 mm) gypsum board and reflective air space.

Table 4—R-Values For 10 in. (254 mm) Concrete Masonry Walls, hrft^{2.0}F/Btu^a

| Construction | Density of concrete, pcf | Cores Empty range mid | | Cores filled with ^b : | | | | | | | |
|--|--------------------------------|----------------------------------|------|----------------------------------|------|-------------|------|-----------------------------------|------|---------------|------|

^a Notes: $(\text{hr} \cdot \text{ft}^{2,0} \text{F/Btu}) (0.176) = \text{m}^2 \cdot \text{K/W}$. Mortar joints are $\frac{3}{8}$ in. (10 mm) thick, with face shell mortar bedding assumed. Unit dimensions based on *Standard Specification for Loadbearing Concrete Masonry Units*, ASTM C 90 (ref. 2). Surface air films are included.

^b Values apply when all masonry cores are filled completely. Grout density is 140 pcf (2243 kg/m³). Lightweight grouts, which will provide higher R-values, are also available in some areas.

^c Installed over wood furring. Includes $\frac{1}{2}$ in. (13 mm) gypsum board and nonreflective air space.

^d Installed over wood furring. Includes $\frac{1}{2}$ in. (13 mm) gypsum board and reflective air space.

The values for insulated and grouted cores in Tables 1 through 5 are based on the assumption that all masonry cores are either insulated or grouted. That is, for walls which are either not grouted or are fully grouted, the values in Tables 2 through 5 can be used directly.

R-VALUES FOR PARTIALLY GROUTED MASONRY

For partially grouted walls, the values in Tables 2 through 5 must be modified. The first step is to determine how much of the wall area is grouted, from Table 1. The U-factor of the wall is calculated from the area-weighted average of the U-factor of the grouted area and the U-factor of the ungrouted area as follows:

$$U = (a_{gr} \times U_{gr}) + (a_{ungr} \times U_{ungr}) \text{ and } R = 1/U$$

where:

a_{gr} = fractional grouted area of wall

a_{ungr} = fractional ungrouted area of wall

R = total thermal resistance of wall, hr·ft²·°F/Btu (m²K/W)

U = total thermal conductance of wall, Btu/hr·ft²·°F (W/m²K)

U_{gr} = conductance of fully grouted wall, Btu/hr·ft²·°F (W/m²K)

U_{ungr} = conductance of ungrouted wall, Btu/hr·ft²·°F (W/m²K)

For example, consider an 8 in. (203 mm) wall composed of hollow 105 lb/ft³ (1682 kg/m³) concrete masonry, and grouted at 48 in. (1219 mm) o.c. both vertically and horizontally. The ungrouted cores contain perlite loose fill insulation.

From Table 1, 31% of the wall is grouted and 69% contains insulation. From Table 3, the R-value for a solidly grouted concrete masonry wall is 1.7 hr·ft²·°F/Btu (0.30 m²K/W). The corresponding U-factor is 1/1.7 or 0.588 Btu/hr·ft²·°F (3.3 W/m²K). Again from Table 3, a wall containing perlite loose fill insulation has an R-value of 5.2, with a corresponding U-factor of 0.192. The U-factor and R-value of the wall are calculated as follows:

$$\begin{aligned} U &= a_{gr} \times U_{gr} + a_{ungr} \times U_{ungr} \\ &= (0.31 \times 0.588) + (0.69 \times 0.192) \\ &= 0.315 \text{ Btu/hr·ft}^2\cdot^\circ\text{F} (1.79 \text{ W/m}^2\text{K}) \end{aligned}$$

$$R = 1/U = 1/0.315 = 3.2 \text{ hr·ft}^2\cdot^\circ\text{F/Btu} (0.56 \text{ m}^2\text{K/W})$$

Table 6—Thermal Data Used to Develop Tables

| Material: | Thermal resistivity (R-value per inch), hr·ft ² ·°F/Btu·in (m·K/W) |
|---|---|
| Vermiculite | 2.27 (15.7) |
| Perlite | 3.13 (21.7) |
| Expanded polystyrene | 4.00 (27.7) |
| Extruded polystyrene | 5.00 (34.7) |
| Cellular polyisocyanurate, gas-impermeable facer | 7.04 (48.8) |
| Polyurethane foamed-in-place insulation | 5.91 (41.0) |
| Wood | 1.00 (6.9) |
| Concrete: | |
| 85 pcf | 0.23-0.34 (1.6-2.4) |
| 95 pcf | 0.18-0.28 (1.2-1.9) |
| 105 pcf | 0.14-0.23 (0.97-1.6) |
| 115 pcf | 0.11-0.19 (0.76-1.3) |
| 125 pcf | 0.08-0.15 (0.55-1.0) |
| 135 pcf | 0.07-0.12 (0.49-0.83) |
| 140 pcf | 0.06-0.11 (0.40-0.78) |
| Mortar | 0.20 (1.4) |
| Material | R-value, hr·ft ² ·°F/Btu (m ² K/W) |
| 1/2 in. (13 mm) gypsum wallboard | 0.45 (0.08) |
| Inside surface air film | 0.68 (0.12) |
| Outside surface air film | 0.17 (0.03) |
| Nonreflective air space | 0.97 (0.17) |
| Reflective air space | 2.38 (0.42) |
